

Five Myths About Aging

Myth 1

The older you get, the less sleep you need.

We might wish this were the case, but older adults still need 7 to 9 hours of sleep each night. Adequate sleep can help reduce your risk of falls, improve your overall mental well-being, and help reduce your risk for certain health conditions.

Myth 2

Depression is normal in older adults.

Although depression is a common mood disorder, it is not a normal part of aging. Talk with your doctor if you begin showing signs of depression, such as irritability or decreased energy.

Myth 3

Older adults can't learn new things.

Not true! Older adults can still learn new things, create new memories, and improve their performance on a variety of skills.

Myth 4

Memory problems always mean Alzheimer's disease.

Not all memory problems are a sign of Alzheimer's disease. Talk with your doctor to determine whether the memory changes you're noticing are normal or whether they may be a sign of something more serious.

Myth 5

Older adults do not need to exercise.

Older adults have a lot to gain by being active — and a lot to lose by sitting too much. Exercise and physical activity can help manage some chronic conditions, improve mental and physical health, and maintain independence as you age.
